

Why PixeSci, in five answers.

What's changing, what happens if you wait, where you end up, how we get you there, and why you can believe us.

01

THE BIG CHANGE

What's changing in your world?

AI agents are coming to the lab.

Small and mid-size regulated labs don't yet know how to use them, or how far to trust them. We help you get there, with every decision staying with your team.

02

WINNERS AND LOSERS

What happens if you wait?

Labs that don't use AI get left behind.

TIME

Hours lost to work no one should do by hand.

COST

The price of repeated human errors.

TIMING

Retrospective QC that finds problems late.

How we know: the same gaps keep showing up in FDA findings.

Manual transcription errors

Runs not reconciled to results

Missing or split raw records

Audit trails not reviewed

Environmental excursions not investigated

Incomplete OOS and deviation investigations

Quality unit stretched thin

03

THE PROMISED LAND

What does winning look like?

Your team hands off the repetitive work and does more of the thinking.

Repetitive work, handed off

Error-prone tasks go to AI agents.

Scientists free to think

More thinking, faster innovation.

All your QC tools in one platform

Intelligently integrated.

Agents always watching

Watching your QC and running repetitive workflows.

04

THE WAY THERE

How do we get you there?

We integrate your QC workflow and move you into an agentic ecosystem.

Repetitive tasks get automated away and expensive errors go down.

Quality Core

Evidence gets rebuilt after the fact.

One connected record, so the answer is already there.

Integrations

Your systems don't talk to each other.

We connect them, so your team stops being the glue.

Agentic Automation

Someone has to connect it all by hand.

Routine QC work runs for you, with your sign-off.

Continuous Quality Monitoring

Problems surface late.

We watch around the clock and flag early.

PixeSci works for you and never approves, closes, releases, invalidates, or signs a record on its own. It runs on a PixeSci Node installed at your site, for fast deployment.

05

THE PROOF

Why should you believe us?

We've put this to work in real labs, and we're honest about what's live.

Where it started

We first put this workflow automation to work in academic labs, and built it up for regulated ones.

See it on your own workflow

Bring one process where evidence is hardest to pull together, and we will show you how it looks connected.

Connected today

PixeSci's own Laboratory, Quality, Materials, Manufacturing, Equipment, and Document Control modules; an open-source chromatography data system connector; and a CSV gateway for balance, pH meter, and qPCR data. Direct connectors for major chromatography systems and more instrument vendors are on our roadmap.

WORKFLOW MAPPING

Map your QC process.

Show us where your tools, partners, and reviews disconnect. We will show you how to connect them and keep the record.

SCAN TO BOOK A DEMO

Our core mission is to create a disease-free world by pushing regulated life science companies into autonomous quality control.

Teams can track work and produce records for review. Customers still must validate and configure the system, train users, maintain SOPs, and meet their own quality requirements. The gap patterns shown are common across regulated labs and do not describe any named company or inspection. © 2026 PixeSci.
